## 1 Project Name: Kmeans Clustering Implementation

```
In [1]: from kmeans import *

from sklearn.ensemble import RandomForestClassifier
from sklearn.cluster import SpectralClustering
from sklearn.datasets import make_blobs
from sklearn.datasets import load_breast_cancer
from sklearn.metrics import confusion_matrix
from sklearn.metrics import accuracy_score

import numpy as np
import matplotlib.pyplot as plt
from PIL import Image
from collections import Counter
```

## 2 Blob Clustering

- From the first graph with 2 subplots, we can see that kmeans++ method give better output than centroids=None method.
- From the second graph, we can see that kmeans++ method can really make sparse initial centroids. That's where it works better than normal method.

### 2.1 kmeans

```
In [2]: # kmeans++ has sparse initial centroids
k = 3
X, y = make_blobs(n_samples=1500, random_state=170)
```

```

In [3]: # my prediction
results = []
for c in ['kmeans++', None]:
    centroids, clusters = kmeans(X=X, k=k, centroids=c)
    y_pred = np.zeros([len(X), 1])
    for cluster_number in range(k):
        y_pred[clusters[cluster_number]] = cluster_number
    y_pred = y_pred.reshape(1, -1)[0]
    results.append(y_pred)

plt.figure(figsize=(12, 12))
plt.subplot(211)
plt.scatter(X[:, 0], X[:, 1], c= results[0])
plt.title('my kmeans clustering with centroids=kmeans++')
plt.subplot(212)
plt.scatter(X[:, 0], X[:, 1], c= results[1])
plt.title('my kmeans clustering with centroids=None')

```

Out[3]: Text(0.5, 1.0, 'my kmeans clustering with centroids=None')

## 2.2 kmeans++

```
In [4]: # kmeans++ initialization gives sparse initial centroids
centroids = init_centroids(X=X,k=k) # init sparse centroids, not randomly i
plt.scatter(X[:, 0], X[:, 1], c= y)
plt.scatter(centroids[0,0],centroids[0,1],c='red')
plt.scatter(centroids[1,0],centroids[1,1],c='blue')
plt.scatter(centroids[2,0],centroids[2,1],c='lime')
plt.title('sparse initial centroids with kmeans++ ')
```

Out[4]: Text(0.5, 1.0, 'sparse initial centroids with kmeans++ ')

## 3 Binary Prediction

- In this kind of case, kmeans clustering can be used for classification, normally with good accuracy.
- Here, it's important to link our cluster number with its correct group, we should flip\_over predictions when necessary.

```
In [5]: cancer = load_breast_cancer()
X = cancer.data
y = cancer.target
print('{:.2%} observations has y_true=1'.format(y[y==1].shape[0]/y.shape[0])
# y=0 cancer, y=1 benign
```

62.74% observations has y\_true=1

### 3.1 Method 1 to match groups with labels

- The Basic idea, is to identify each cluster's size.
- Sort values in y by its counts, then associate clusters in y\_pred with labels by finding its rank in value\_counts.
- To be more specific, in this case, the bigger cluster would be assigned label=1.
- Pros: can deal with multi\_classification problems.

- Cons: when clusters' size are similar, it may fail to find its correct label.

```

In [6]: def sort_by_counts(y):
        # return a list of tuples, like [(1, 357), (0, 212)]
        return sorted(Counter(y).items(),key=lambda x:x[1],reverse=True)

def flip_over_if_necessary(y,y_pred):
    sorted_y = sort_by_counts(y)
    sorted_y_pred = sort_by_counts(y_pred.reshape(1,-1)[0])
    # similar distribution, same order in counts
    if [item for item,count in sorted_y] == [item for item,count in sorted_
        y_pred
        return y_pred
    else:
        y_pred_new = y_pred
        for i in range(len(sorted_y)):
            y_pred_new[clusters[int(sorted_y_pred[i][0])]] = sorted_y[i][0]
        return y_pred_new

for i in range(1,11):
    print('Test Number {}'.format(i))
    k = 2
    centroids, clusters = kmeans(X, k)

    y_pred = np.zeros([len(X), 1])
    for cluster_number in range(k):
        y_pred[clusters[cluster_number]] = cluster_number

    accuracy_before = accuracy_score(y, y_pred.reshape(1, -1)[0])
    print('Accuracy before flip_over : \n {:.4f}'.format(accuracy_before))

    # flip_over according to the value_counts distribution
    y_pred = flip_over_if_necessary(y,y_pred)

    accuracy = accuracy_score(y, y_pred.reshape(1, -1)[0])
    print('Accuracy : \n {:.4f}'.format(accuracy))
    if accuracy<0.5:
        print('Failed !!! Because predicted clusters have similar sizes !!!')
    print('Confusion Matrix : \n {} \n'.format(confusion_matrix(y, y_pred))

```

## 3.2 Method 2 to match groups with labels

- The basic idea, is to investigate the performance of clustering.
- To be more specific, in this case, if  $\text{accuracy} < 0.5$ , we flip\_over the prediction, and recalculate the metrics.
- In this case, method 2 works better than method 1, because 62.74% observations has  $y_{\text{true}}=1$ . When the clusters' size don't differ that much, method 1 would fail to implement flip\_over, even though it's really necessary.

```

In [7]: accuracies_kmeans = []

for i in range(1, 6):
    print('Test Number {}'.format(i))
    k = 2
    centroids, clusters = kmeans(X, k)

    y_pred = np.zeros([len(X), 1])
    for cluster_number in range(k):
        y_pred[clusters[cluster_number]] = cluster_number

    accuracy_before = accuracy_score(y, y_pred.reshape(1, -1)[0])
    if accuracy_before < 0.5: # simple-judge
        print('Accuracy before flip_over : \n {:.4f}'.format(accuracy_before))
        y_pred = np.where(y_pred==1,0,1) # flip it

    accuracy = accuracy_score(y, y_pred.reshape(1, -1)[0])
    accuracies_kmeans.append(accuracy)
    print('Accuracy : \n {:.4f}'.format(accuracy))
    print('Confusion Matrix : \n {} \n'.format(confusion_matrix(y, y_pred)))

```

## 4 Image Compression

### 4.1 Greyscale image

- set the points that has similar grey\_value to a single (centroid) value.

```
In [8]: image_path = 'north-africa-1940s-grey.png'
img = np.array(Image.open(image_path))
# the greyscale value given by img[i][j]
```

```
In [9]: display(Image.fromarray(img))
```

```
In [10]: X = img.reshape(-1,1)
# Number of cluster k : how many grey_values are chosen.
k = 4
centroids, clusters = kmeans(X,k,centroids='kmeans++')
# get the four centroids, many points grey_value are around these centroids
centroids = centroids.astype(np.uint8)

y_pred = np.zeros([len(X), 1])
# convert all the grey_values to the 4 centroids
for cluster_number in range(k):
    y_pred[clusters[cluster_number]] = centroids[cluster_number]
```

```
In [11]: y_pred = y_pred.reshape(img.shape)
grey_img = y_pred.astype(np.uint8)
display(Image.fromarray(grey_img))
```

## 4.2 Color image

- set the points that have similar color to a single (centroid) color.

```
In [16]: image_path_2 = 'lake.jpeg'
img_2 = np.array(Image.open(image_path_2))
display(Image.fromarray(img_2))
```

```
In [17]: X = img_2.reshape(-1,1,3) # 3 for red, greeb, blue
k = 32

centroids, clusters = kmeans(X,k,centroids= 'kmeans++')
centroids = centroids.astype(np.uint8)
y_pred = np.zeros([len(X), 3])
# convert all the colors to the 32 colors
for cluster_number in range(k):
    y_pred[clusters[cluster_number]] = centroids[cluster_number]
```

```
In [18]: y_pred = y_pred.reshape(img_2.shape[0],img_2.shape[1],3)
         clor_img = y_pred.astype(np.uint8)
         display(Image.fromarray(clor_img))
```

## 5 Advanced: Spectral Clustering

```
In [19]: cancer = load_breast_cancer()
         X = cancer.data
         y = cancer.target
```

```

In [20]: accuracies_spectral = []

for i in range(1,6): # different random_state in rf for each i
    print('Test Number {}'.format(i))
    rf= RandomForestClassifier() # different random_state
    rf.fit(X,y)
    S = similarity_matrix(X,rf)
    cluster = SpectralClustering(n_clusters=2, affinity='precomputed')
    y_pred = cluster.fit_predict(S) # pass similarity matrix not X
    if accuracy_score(y,y_pred)<0.5: # might needs to flip_over
        y_pred = np.where(y_pred==1,0,1)
    accuracy = accuracy_score(y, y_pred)
    accuracies_spectral.append(accuracy)
    print('Accuracy : \n {:.4f}'.format(accuracy))
    print('Confusion Matrix : \n {} \n'.format(confusion_matrix(y, y_pred)))

print('In Average, Accuracy_spectral = {:.4f}'.format(np.mean(accuracies_sp

Test Number 1
Accuracy :
0.9701
Confusion Matrix :
[[201  11]
 [  6 351]]

Test Number 2
Accuracy :
0.9684
Confusion Matrix :
[[201  11]
 [  7 350]]

Test Number 3
Accuracy :
0.9772
Confusion Matrix :
[[204   8]
 [  5 352]]

[[205   7]
 [  5 352]]

In Average, Accuracy_spectral = 0.9733

```

```
In [21]: print('In Average, Accuracy_kmeans = {:.4f}'.format(np.mean(accuracies_kmeans)))  
print('In Average, Accuracy_spectral = {:.4f}'.format(np.mean(accuracies_spectral)))
```

```
In Average, Accuracy_kmeans = 0.8805
```

```
In Average, Accuracy_spectral = 0.9733
```

- Spectral\_Clustering has higher average accuracy than Kmeans\_Clustering in the cancer\_or\_not classification problem.

## 6 Summary

- I implemented kmeans clustering (both kmeans and kmeans++ algorithm) from scratch.
- I achieved these applications with my own kmeans clustering code: blob clustering, binary prediction, image compression, and spectral clustering.
